# When you renew, you will be helping to shape the future of human health and disease with pioneering research

Without decades of published physiological research providing the foundation of scientific development, discoveries would remain hidden.

We're on a mission to advance physiological science by bridging the past with the future of scientific inquiry.

Imagine the impact on our world if we didn't understand:

- how memories are formed and stored in the brain, we couldn't diagnose and treat neurological conditions like Alzheimer's

- major risks to our hearts like high blood pressure, high cholesterol, smoking, obesity and diabetes, we couldn't reduce heart disease

- the effects of exercise on the human body, we would be more prone to injury

- the mechanics of breathing and gas exchange, we couldn't advance treatments in respiratory conditions like asthma

- how kidneys regulate blood pressure and fluid balance, we couldn't improve outcomes and quality of life

Support your researchers with integral knowledge to help shape their understanding of human health and disease and advance scientific discoveries with our Legacy Collection.
